

I claim:

1. A device for receiving liquids to which solids have been added, comprising:

a body having one open end and an inner chamber; and

a loss plate closing off said body, said loss plate having an opening formed therein.

2. The device according to claim 1, wherein said opening is centrally disposed in said loss plate.

3. The device according to claim 1, wherein said loss plate has a convexity.

4. The device according to claim 1, wherein said loss plate has a peripheral thickening at said opening.

5. The device according to claim 4, wherein said peripheral thickening is a rib.

6. The device according to claim 4, wherein said peripheral thickening is a web.

7. The device according to claim 4, wherein said peripheral thickening is a bead.

8. A device for receiving liquid waste to which solids have been added, from nuclear power stations, comprising:

a body having one open end and an inner chamber; and

a loss plate closing off said body, said loss plate having an opening formed therein.

9. A device for removing liquid from a receiving device having a body with one open end and an inner chamber, and a loss plate closing off the body and having an opening formed therein, the device for removing liquid, comprising:

an inner chamber;

a pipe communicating with said inner chamber for leading away liquid; and

a cover for bearing on the receiving device, said cover having an opening formed therein in the vicinity of said inner chamber, said cover having a side facing toward the receiving device, and said cover having at least one seal at said side for bearing on the loss plate.

10. The device according to claim 9, wherein said cover has an outer periphery and a further seal on said outer periphery for bearing on the receiving device.

11. The device according to claim 9, including a cleaning device for said inner chamber.

12. The device according to claim 9, wherein said inner chamber is substantially cylindrical.

13. A device for removing liquid from a receiving device having a loss plate, the device for removing liquid, comprising:

an inner chamber;

a pipe communicating with said inner chamber for leading away liquid; and

a cover for bearing on the receiving device, said cover having an opening formed therein in the vicinity of said inner chamber, said cover having a side facing toward the receiving device, and said cover having at least one seal at said side for bearing on the loss plate.
